

# Restriction enzymes and PCR

David Andrés Ayala Usma

# Restriction endonucleases (RE)

# What?

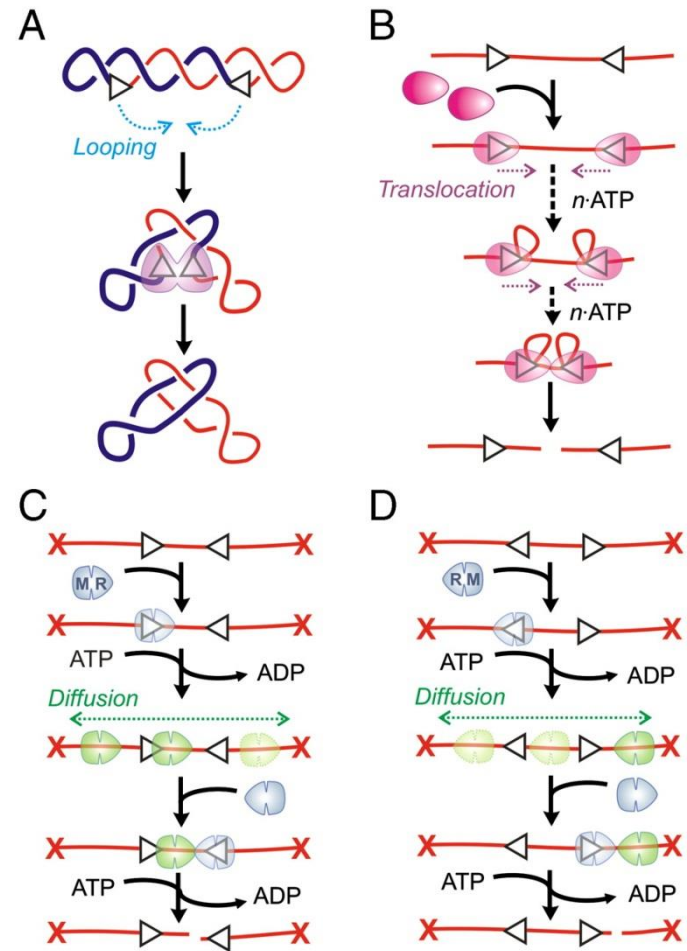

- Enzymes or enzymatic complexes which cleave *inside* DNA molecules (Not 5' or 3' ends).
- Three types: I, II and III.
- Sequence-specific.
- Blunt or sticky ends

# What?

Dryden, 2004

Van Aelst et al., 2010

# Who?

The Nobel Prize in Physiology or Medicine 1978  
Werner Arber, Daniel Nathans, Hamilton O. Smith

# Type II RE

- Type II RE recognize a specific sequence in the DNA and cleave within.
- Hydrolysis of the phosphodiester backbone.
- They only recognize double stranded DNA (dsDNA).
- Blunt or sticky ends.

© 2006 Encyclopædia Britannica, Inc.

# Type II RE subtypes

- IIS: Asymmetric recognition of a site. Cleavage in the neighboring 20 bp of the specific sequence.
- IIB: Cleaves DNA on both strands at the ends of the specific sequence.
- IIE: Requires two sites for recognition but cleaves only one of them.
- IIF: Requires two copies of the recognition sequence, and cleaves within both sites.

# Cleavage

## 5' prime overhanging ends

These are shapes of 5' overhangs (in the usual representation)

You can rotate them 180 degrees  
and they look the same!

The 5' phosphate groups (in red) are exposed,  
and the 3' hydroxyl groups (in blue) are recessed.

## 3' prime overhanging ends

These are shapes of 3' overhangs (in the usual representation)

You can rotate them 180 degrees  
and they look the same!

The 5' phosphate groups (in red) are recessed,  
and the 3' hydroxyl groups (in blue) are exposed.

## blunt (non-overhanging) ends

These are shapes of blunt ended molecules (in the usual representation)

You can rotate them 180 degrees  
and they look the same!

The 5' phosphate groups (in red) are flush  
with the 3' hydroxyl groups (in blue).

# Famous enzymes

## Some restriction enzymes

Enzyme	Source organism	Restriction recognition site in double-stranded DNA	Structure of the cleaved products
(a) <i>EcoRI</i>	<i>Escherichia coli</i>		<p>5' overhang</p>
<i>PstI</i>	<i>Providencia stuartii</i>		<p>3' overhang</p>
<i>SmaI</i>	<i>Serratia marcescens</i>		<p>Blunt ends</p>
(b) <i>HaellI</i>	<i>Haemophilus aegyptius</i>		<p>Blunt ends</p>
<i>HpaII</i>	<i>Haemophilus parainfluenzae</i>		<p>5' overhang</p>

# Practice!

GAGGATCCCACCAGGGTTACAGGATAGGAGTCAGGATCCAGAGGACCTAGGATACCTC  
CTCCTAGGGTGGTCCCAATGTCCTATCCTCAGTCCTAGGTCTCCTGGATCCTATGGAG

How many fragments are produced?  
Which length does it (do they) have?

# Practice!

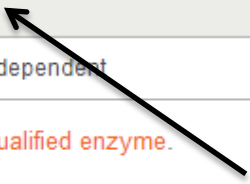

# Digestion

## A "Typical" Restriction Digest

Restriction Enzyme	10 units is sufficient, generally 1 $\mu$ l is used
DNA	1 $\mu$ g
10X NEBuffer	5 $\mu$ l (1X)
BSA	Add to a final concentration of 100 $\mu$ g/ml (1X) if necessary
Total Reaction Volume	50 $\mu$ l
Incubation Time	1 hour*
Incubation Temperature	Enzyme dependent

\* Can be decreased by using a **Time-Saver Qualified enzyme**.

Star activity in  
some cases!

## Buffer

- Use at a 1X concentration
- If required, add BSA to a final concentration of 100  $\mu$ g/ml (1:100 dilution)
- Restriction enzymes that do not require BSA for optimal activity are not adversely affected if BSA is present in the reaction

EcoRI

Select 2nd enzyme

PstI

Go

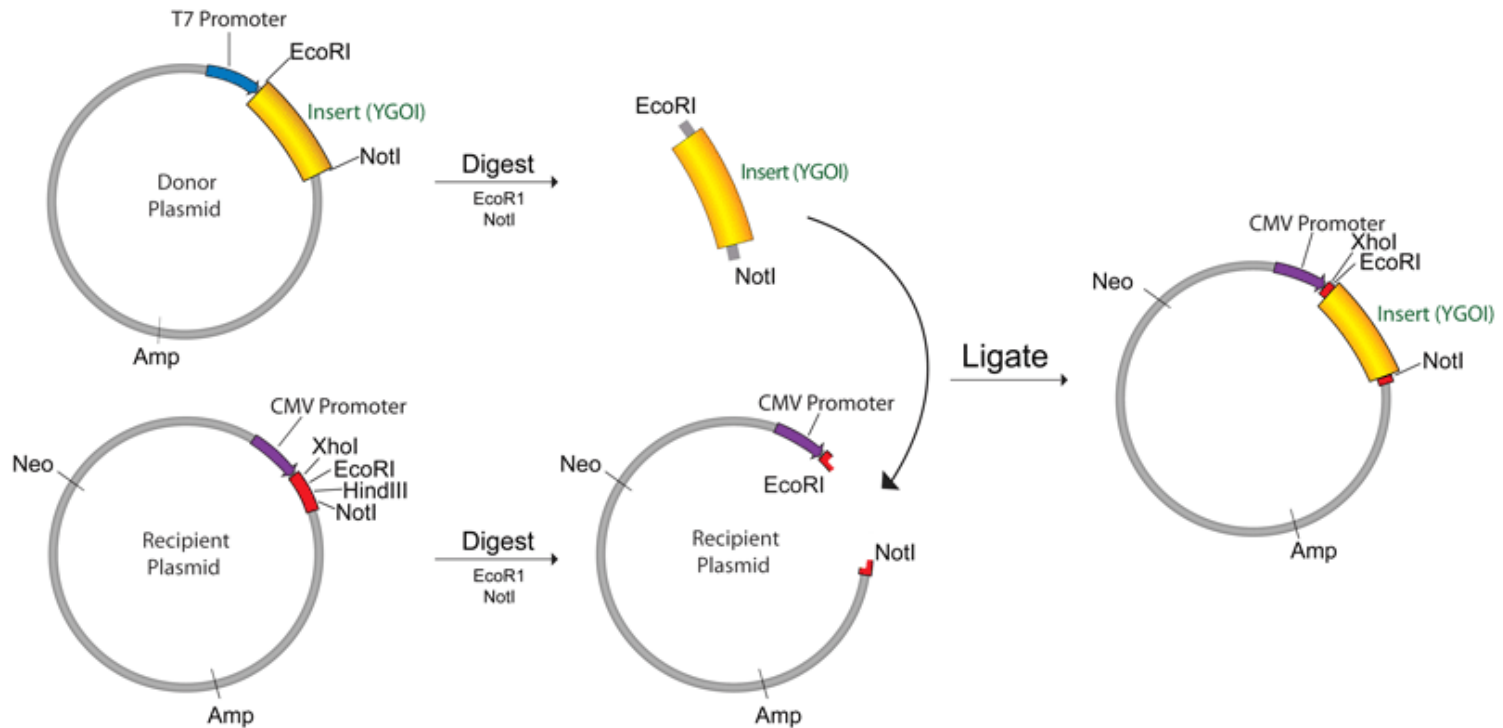

Enzyme	Cat #	Temp	Supplied NEBuffer	Supplements	% Activity in NEBuffer			
				SAM	1.1	2.1	3.1	CutSmart
EcoRI 	R0101	37°C	NEBuffer EcoRI	no	25	100*	50	50*
PstI 	R0140	37°C	NEBuffer 3.1	no	75	75	100	50*

## Double Digest Recommendations for EcoRI + PstI:

- Digest in NEBuffer 3.1 at 37°C.
- *At least one enzyme has < 100% activity in this buffer, so additional units of enzyme and/or longer incubation time may be necessary.*
- *EcoRI has a High Fidelity version **EcoRI-HF™** (R3101)  
PstI has a High Fidelity version **PstI-HF™** (R3140)  
High Fidelity (HF) Restriction Enzymes have been engineered for reduced star activity and have 100% activity in CutSmart Buffer which may simplify your double digest.*
- *\* May exhibit star activity in this buffer.*

Learn more about improvements to the NEB Restriction Enzyme Buffer System

# What is it used for?

# What is it used for?

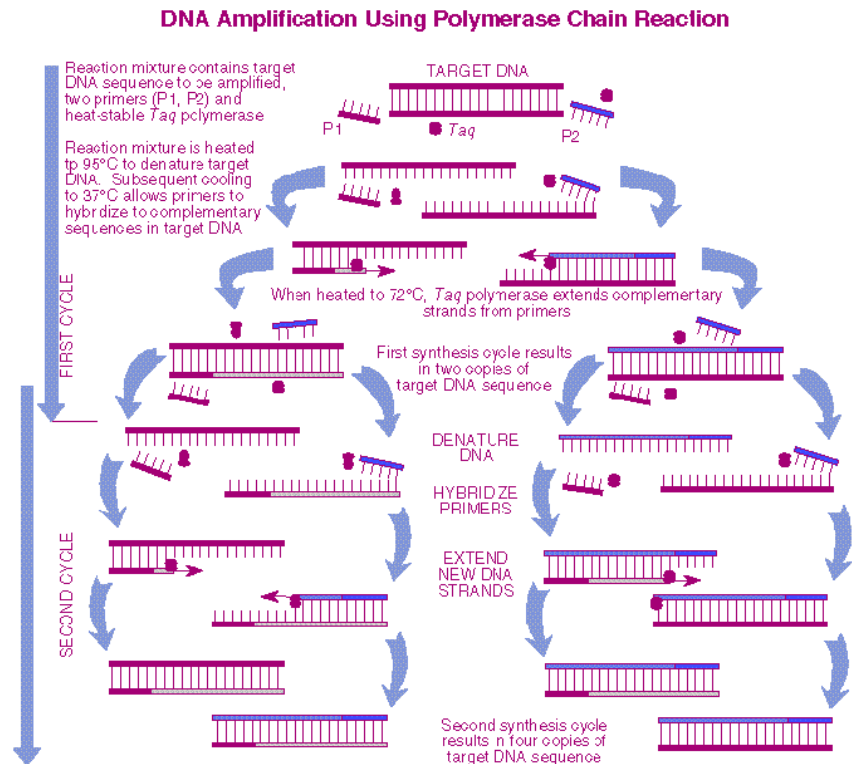

PCR

# What?

- *In vitro* enzymatic reaction for copying a particular sequence of DNA
- Doesn't need high quantities of DNA to work.
- Lots and lots of applications.
- Detection, cloning, sequencing...

# How does it work?

- [http://www.youtube.com/watch?v= YgXcJ4n-kQ](http://www.youtube.com/watch?v=YgXcJ4n-kQ)

# Typical PCR reaction

Reactivo	Concentración del stock	Concentración reacción
Agua		
MgCl <sub>2</sub>	25 mM	2,5 mM
Buffer	10X	1X
dNTPs	10 mM	0,2 mM
352-F	10 μM	0,3 μM
975-R	10 μM	0,3 μM
Taq polimerasa	5 U/μl	1,5 U
Extracto crudo		

# Typical PCR reaction

PCR Condition using heat stable polymerase (Taq polymerase)

# Typical PCR reaction

# Tips and tricks

- Reagent concentrations - "less is usually better" (more specific)
  - primers: final concentration 0.1-1.0  $\mu$ M
  - $MgCl_2$ : final concentration 1.0-4.0 mM (depends on Taq used)
  - dNTPs: final concentration 0.2 mM each dNTP (depends on Taq used)
    - Note: sensitive to repeated freeze/thaws
- Vortex or finger-flick reagents to mix well before use
- Annealing temperature and step times are important
- Hot starts improve reaction efficiency (fewer primer-dimers)
  - Manual: add Taq to tubes in thermalcycler at 94°C (or  $MgCl_2$  or dNTPs)
  - TaqStart Antibody (Clontech)
  - FastStart Taq (Roche)

# Tips and tricks

- Always check program on Thermal Cycler
- Run negative control(s) to check for contamination
- Make a flow chart of what tried and in what order
- Run a positive control (a sample known to amplify well)
- Always run a ladder on gel (will indicate whether failed PCR or failed detection system)
- Additives for fragments that are very long, G-C rich or prone to secondary structure
  - Glycerol, Formamide, NMP : Allow lower denaturing and annealing temperatures by a few degrees.
  - DMSO decreases incidence of secondary structure

# Primers

# Primers

# Primers

- General Guidelines

[http://www.premierbiosoft.com/tech\\_notes/PCR\\_Primer\\_Design.html](http://www.premierbiosoft.com/tech_notes/PCR_Primer_Design.html)

- Always write the primer from 5' to 3' ([Reverse complement](#) on Rv)

# Primers

## Primer3

[Home](#)[Web Interface](#)[Download](#)[History](#)

Primer3 is a widely used program for designing PCR primers (PCR = "Polymerase Chain Reaction"). PCR is an essential and ubiquitous tool in genetics and molecular biology. Primer3 can also design hybridization probes and sequencing primers.

PCR is used for many different goals. Consequently, primer3 has many different input parameters that you control and that tell primer3 exactly what characteristics make good primers for your goals.

Primer3 -- the C code, the web interface, and the documentation -- are an open source, community-development project hosted by SourceForge.

# Primer-BLAST

- Two modules
  - Generate candidate primers
    - Primer 3
  - Candidate checking
    - Search against nucleotide databases. Looks for specificity.

The screenshot shows the Primer-BLAST web interface. At the top, there are three links: [Reset page](#), [Save search parameters](#), and [Retrieve recent results](#). Below these is a tab labeled "PCR Template". The main input area contains a text box with the placeholder text "Enter accession, gi, or FASTA sequence (A refseq record is preferred)" and a "Clear" link. Below the text box is a large empty box with the text "Max. 50Kb". To the right of the text box is a "Range" section with two columns: "From" and "To". Below these are two rows of input boxes: "Forward primer" and "Reverse primer". To the right of the "Reverse primer" row is a "Clear" link. At the bottom left, there is a section for uploading a FASTA file, with the text "Or, upload FASTA file" and a "Browse..." button.

## Abstract

Inverse fusion PCR cloning (IFPC) is an easy, PCR based three-step cloning method that allows the seamless and directional insertion of PCR products into virtually all plasmids, this with a free choice of the insertion site. The PCR-derived inserts contain a vector-complementary 5'-end that allows a fusion with the vector by an overlap extension PCR, and the resulting amplified insert-vector fusions are then circularized by ligation prior transformation. A minimal amount of starting material is needed and experimental steps are reduced. Untreated circular plasmid, or alternatively bacteria containing the plasmid, can be used as templates for the insertion, and clean-up of the insert fragment is not urgently required. The whole cloning procedure can be performed within a minimal hands-on time and results in the generation of hundreds to ten-thousands of positive colonies, with a minimal background.

# Inverse Fusion PCR cloning

## Primer design

## Inverse fusion PCR cloning

# Design tips

- There are lots of programs for primer design, but are very limited for this family of techniques.
- Primers in Fusion PCRs tend to be veeeeery loooooong (40-60 pb). Don't panic!
- Again, high complementarity at the 3' end of the primer, and high GC% in the last nucleotides of this end if possible.
- Check carefully the formation of secondary structures and primer dimers (avoid values < -5 Kcal/mol).
- When adding restriction sites at the ends of the sequence, insert at least 4 nucleotides more at the end of the primer, so the RE activity is not impeded. Consultar: <http://goo.gl/zu9cz>
- Play with temperature gradients, Touchdown PCR, DMSO, betain or Two-Step PCR when it's inevitable to have horrible primers.

# Design tips

- If you're intending to fuse protein domains, BE CAREFUL. Frame shifts are an important issue if the primers are not properly designed. Mind the frame!
- Some researchers add spacer residues between domains, to avoid (more) folding errors in the final protein.
- Check first if your sequence has the restriction sites you want to include. If so, change the sites in your primers to avoid unnecessary time and money consumption.
- If you have a sequence visualization software, things flow easier: Geneious, CLC Sequence Viewer, Sequencher, UGENE...
- More magic tricks! <http://goo.gl/23cPXy>
